VB.Net More on Web Browser Favourites
Tutorial (try twirling round bottom of
image for a synopsis ... 'do the twirl
now')

Do you remember the tutorial [VB.Net Web Browser Favourites Primer Tutorial](#)? Well, with this tutorial we add an onion layer on top. This is the way I really like to program. Get the essence right first, then build onion layers on top, and have supervisors of supervisors of supervisors ... for Onion a then Onion 1-a then Onion A-1-a ... then Onion of the Fourth Dimension! So that new onion layer of ours is to have the Dropdown selection do something before it goes off to that Dropdown My Favourite URL selection. Guess what might be a good thing to use for such an in between (interventionist) procedure. We have HTML, so what can be like an onion layer on top of the client-facing HTML/Javascript? Something [server-side](#)? What about PHP? So we'll get the VB.Net to write its own PHP. Why not? It knows where to write it, because, as with the previous tutorial, it assumes you have [EasyPHP](#) going (big assumption, but think you can handle the changes if you have another local webserver arrangement ... hint: look for code with //127.0.0.1).

This [PHP](#) does a line and character count of the destination URL and does a (bit of an awkward HTML) word count as well, showing this to you in a Javascript [alert\(\) box](#) before proceeding to the actual website using [window.location=?](#) methods.

Download this VB.Net code as required and rename to [Module1.vb](#).
